1 Introduction

This document gives an overview of the USB Mass Storage Class specifications. How mass storage devices behave on the USB bus is the subject of this and other USB Mass Storage Class specifications. In addition to this Overview specification, several other USB Mass Storage Class specifications are supported by the USB Mass Storage Class Working Group (CWG). The titles of these specifications are:

- USB Mass Storage Class Control/Bulk/Interrupt (CBI) Transport
- USB Mass Storage Class Bulk-Only Transport
- USB Mass Storage Class UFI Command Specification
- USB Mass Storage Class Bootability Specification
- USB Mass Storage Class Compliance Test Specification

The USB Mass Storage Class Control/Bulk/Interrupt (CBI) Transport specification is approved for use only with full-speed floppy disk drives. CBI shall not be used in high-speed capable devices, or in devices other than floppy disk drives. Usage of CBI for any new design is discouraged.

Note: The Bootability and Compliance Test specifications are still under development, and are not yet publicly available.

1.1 Specification Relationships

The CBI and Bulk-Only specifications are each intended to be stand-alone documents for the USB Mass Storage class, enabling development of a USB Mass Storage compliant device. A device manufacturer may choose to implement both CBI and Bulk-Only, but shall follow each specification as applicable.

Booting an operating system from a USB Mass Storage Class device requires no special considerations with regard to Mass Storage Class support. Either CBI or Bulk-Only devices may be bootable. Bootability may, however, require other considerations such as particular types of media formatting, etc. Such considerations are hardware- or operating system dependent, and are beyond the scope of the Mass Storage Class specifications.

1.2 Purpose

The purpose of this document is to provide an overview of all the specifications that describe how Mass Storage devices behave on the USB bus. Section 1.1 gives the rules for using the different USB Mass Storage class specifications.

Note that these rules can change. As other companies with different USB Mass Storage Class device projects in mind join the USB Mass Storage Class CWG, other specifications may be developed by the CWG and added to the set of specifications that fully describe how a Mass Storage Class device behaves on the USB bus. If and when that happens, the USB Mass Storage CWG will reconsider the rules specified in section 1.1 of this document.

1.3 Terms and Abbreviations

May
- A keyword that indicates an option.

Shall
- A keyword that indicates a requirement.
1.4 Related Documents

USB Mass Storage specifications use the command sets from several existing protocols. The command blocks of these command sets are placed in a USB wrapper which follows USB protocol. The following specifications are referenced by the USB Mass Storage specifications:

- **Advanced Technology Attachment Packet Interface (ATAPI) for CD-ROMs.** SFF-8020i, available from Global Engineering, (800)-854-7179.

- **Reduced Block Commands (RBC),** T10/1240-D, available at [http://www.t10.org/drafts.htm](http://www.t10.org/drafts.htm)

- **Multi-Media Command Set 2 (MMC-2),** available at [http://www.t10.org/drafts.htm](http://www.t10.org/drafts.htm)

- **SCSI Primary Commands – 2 (SPC-2), Revision 3 or later,** available from Global Engineering, (800)-854-7179

- **Universal Serial Bus Specification, 1.0 revision or later** (also referred to as the *USB Specification*). In particular, see Chapter 9, “USB Device Framework.” Available at [http://www.usb.org/developers/devclass.html](http://www.usb.org/developers/devclass.html)
2 Subclass Code

The Interface Descriptor of a USB Mass Storage Class device includes a \texttt{bInterfaceSubClass} field. This field denotes the industry-standard protocol transported by a Mass Storage Class interface. The value of the \texttt{bInterfaceSubClass} field shall be set to one of the Subclass codes as shown in the following table.

Note that the Subclass code values used in the \texttt{bInterfaceSubClass} field specify the industry-standard specification that defines transport protocols and command code systems transported by the interface; these Subclass codes do not specify a type of storage device (such as a CD-ROM or floppy disk drive).

3 Protocol Code

The Interface Descriptor of a USB Mass Storage Class device includes a `bInterfaceProtocol` field. This field denotes the transport protocol used by this interface.

</tbody>
</table>

The USB Mass Storage Class Control/Bulk/Interrupt (CBI) Transport specification (Protocol codes 0x00 and 0x01) is approved for use only with full-speed floppy disk drives. CBI shall not be used in high-speed capable devices, or in devices other than floppy disk drives. Usage of CBI for any new design is discouraged.
